Experiment

The narrative cloze task is a common evaluation task for script induction. I would like to understand humans' performance on the narrative cloze task.

In this task, participants read stories involving a particular entity. One of the events the entity is involved in is left blank. Participants are asked to fill in this blank with a plausible completion.
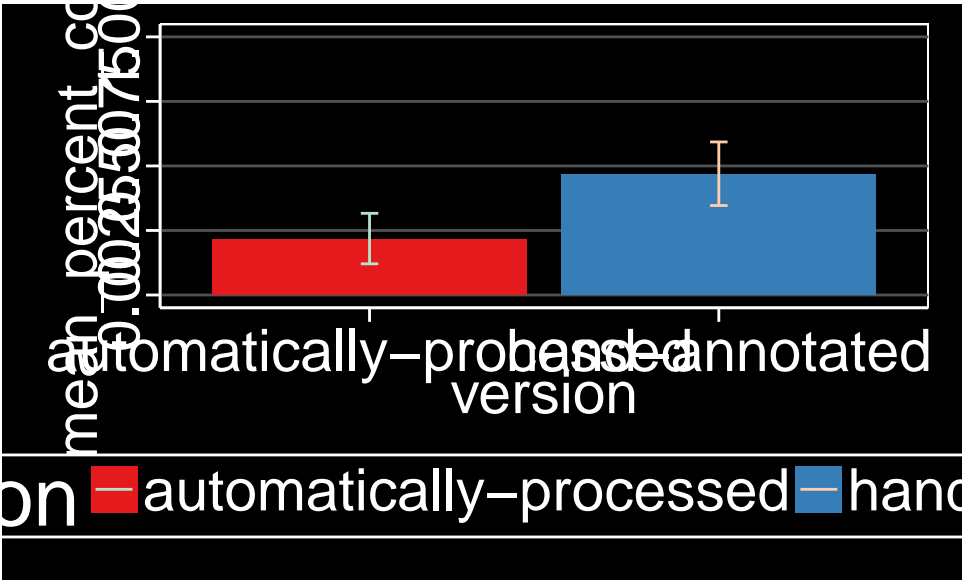

Demographics and attention checks

Average completion time was 8 minutes.

4 participants were excluded for failing an attention check.

Results

How did people do, when we analyze their responses automatically?
